Re: Asylum Lake Preserve seedling spraying

Outlined below is our proposal to treat invasive tree and shrub seedlings throughout the areas that have had cut stump work completed.

On the attached map we have outlined in green the areas that have had some invasive species control work completed. These areas total approximately 51 acres. Invasive tree and shrub seedlings and re-sprouts would be treated throughout this area. Target species will be foliar sprayed with backpack sprayers. Renovate 3, Element 3, or Garlon 3A (active ingredient trichlopyr) will be used for foliar treatments at a mix concentration of 5% by volume. Cygnet Plus surfactant and Tracker blue dye will also be used.

The optimal time for treatment is late spring or early summer but can be completed until late September. The cost for this seedling spraying would be \$6,800. This price includes transportation time and the cost of all materials. This is a fixed price but if you prefer we would be happy to work time and materials as well. If you have any questions please let us know.

Sincerely,

Bill Schneider
